

ERA Reunion – June 15, 2019

Equipment Checklist

- Video recorder – be sure to bring with the wires or mechanisms to download the recording so we can get it to our archivists.
- Smartphone or iPad - you will need at least 2 Gigabytes of storage on your device to record a 45 minute video.
 - Log out of all your apps and turn it completely off before you begin. This eliminates apps running in the background from slowing down your phones capabilities.
 - Be sure to charge your device up. Bring your cord and wall plug (and an extension cord) to keep it juiced up.
 - Put the device in Airplane Mode to eliminate calls and other pop ups while recording.
- Possibly small external microphone and/or tripod to hold phone or iPad or other device, if you have that. Not necessary.

iPhone

- To find out how much storage you have on your iPhone:
 - Go to Settings – General – iPhone Storage
 - Check for available storage – you will need at least 2GB of storage
 - To create space, you can scroll down to see which programs are using up the phone’s storage capacity and delete those items on your phone (or upload the items to your computer or the cloud and then delete them from your phone).
- To set the camera to record at the proper quality on your iPhone:
 - Go to Settings – Camera – Record Video
 - Set recording at 1080p HD at 30 fps if you have 2.7gigabytes of storage
 - Set recording at 720p HD at 30 fps if you have 1.8gigabytes of storage

Android

- To find out how much storage you have on your Android phone:
 - Go to Settings – Storage
 - Check for available storage – you will need at least 2GB of storage
 - To create space, you can scroll down to see which programs are using up the phone’s storage capacity and delete those items on your phone (or upload the items to your computer or the cloud and then delete them from your phone).
- Unless you have changed the recording settings for your camera, the camera will be fine for recording at the proper quality on your Android phone.
